

Kalfire: the first to be ready with **a hydrogen gas fire**

As a state-of-the-art fireplace designer, we closely follow developments in the field of sustainable energy. Hydrogen will play an increasingly prominent role in the energy transition. In Europe, gas suppliers are already mixing hydrogen with natural gas – a sign of things to come. Kalfire gas fires are fully prepared for that future. They can burn a mixture of hydrogen and gas with no adjustments necessary. Our gas fires are future proof and H2-ready.

Sustainable fire

At Kalfire we have a clear mission: connecting people through sustainable fire. This drives us to continuously invest in developing the potential to use new types of energy. Our R&D department is intensively focused on this, and we also participate in international research conducted by the top European testing organizations, providing us with valuable new insights.

Innovation in your home

Our gas fires feature the very latest innovative technology. This puts our products at the leading edge in quality, durability, safety and performance, as well as in sustainability.

Kalfire gas fires are H2-ready for the future.
